View this Frequently Asked Questions (FAQ) article for general information on the product and. In a host environment with Windows NT host, Windows Server 2000.. 2003 Server 2003, Windows 2003Å .Using Hyperlink to Mitigate Security Risks in the Cloud The emergence of cloud computing has increased the reliance on the Internet. As businesses increase the way that they use the Internet, many companies have noticed that it also increases the number of security risks. For instance, when a user does an Internet search using a search engine, the search engine can connect the user to another website over the Internet. While this is not often a security issue, it has become a significant concern for many companies. Two Security Risks When a company uses the Internet, there are two types of security risks associated with this. There are risks from other individuals in the company, as well as risks from the websites that are accessed on the Internet. For instance, the company may be using the Internet to access private data. This can be a significant security risk if it is not adequately protected.

There are many ways to reduce the risks associated with the Internet, including modifying the use and architecture of the Internet. However, the company must also make changes to its own security practices. Using

Hyperlinks The key to preventing the use of the Internet to transfer information on the Internet is avoiding the use of hyperlinks. When a user clicks on a hyperlink, another web page opens. However, it may not be the page that the user intended to see. Instead, the user is transferred to a page that is controlled by the entity that owns the hyperlink. For instance, a search engine that is doing Internet searches will connect the user to a new search website owned by the search engine. To prevent the use of hyperlinks, the company should ensure that it has an architecture in place
